

Skander Hannachi

Technical Solutions Manager, Google Cloud's Applied Ai Engineering

7 lessons learned from 7 years of AI based demand forecasting

This talk is a practitioner-based perspective on the field of Deep Learning and Global Forecasting models for demand forecasting since it first gained prominence in 2017/2018 (Several landmark papers emerged in 2017 along with the M3 competition being won by a Deep Learning based model; Skander started working with AI based forecasting model in 2018).

The "7 lessons" will include antipatterns, best practices, areas where there's more room for exploration, and some ideas on what the future might look like (it is after all a forecasting conference).
